## DETAILED ACTION

### *Claim Rejections - 35 USC § 103*

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1-10, 21-25 and 27 are rejected under 35 U.S.C. 103(a) as being unpatentable over Kim in view of Koike, Fournel and Mizuno (2002/0060352). As stated in the previous action, which is incorporated by reference as to the discussion of the Kim, Koike and Fournel references, the basic structure of a fuse having less layered and more layered parts is well known in the art. In addition, the combination of alternating conductive and insulating layers is also known, as shown by Kim. The new reference to Mizuno also teaches this basic fuse structure, and is specifically cited to show that such fuses used in semiconductor devices may typically include first and second electrode pads with the fuse structure formed there between, as claimed. See, for example, Mizuno's FIG. 3B embodiment. In addition, as seen in FIG. 2 of Mizuno, the glass coating (17) which is formed directly on the fusible metal layer (15) can be considered to constitute a more layered section on either side of a less layered central section which is severed by the trimming laser.

One skilled in the art would be motivated to combine these references because Mizuno uses the same basic fuse structure as the other references, and clearly the electrical current to the fuse must be supplied by external pads at some point for the device to be operable.
